I have conducted an analysis of the New York City Airbnb market using the 2024 listings dataset, containing 12,591 active listings across all five boroughs.

The dashboard reveals a significant pricing disparity across NYC boroughs. Manhattan listings average $193 per night, while the Bronx averages $107 per night. Despite this gap, Brooklyn neighborhoods such as Bedford-Stuyvesant and Harlem dominate the Top 10 most reviewed listings, showing that affordability is driving the demand for guests. Therefore, I recommend that Airbnb begin a program to revitalize underserved boroughs like the Bronx and Queens, using Bedford-Stuyvesant and Harlem as a guide to what entices guests.

According to the dashboard, 55.5% of NYC listings are entire homes, while 42.6% are private rooms. Private rooms are priced competitively and have strong demand. Therefore, Airbnb could encourage property owners to convert underutilized spaces into private room listings. One home offering multiple private rooms can generate more revenue than a single home listing, benefiting the host and Airbnb.

As displayed in the Price Group analysis, $0-100 and $101-$300 price brackets contain the highest number of listings that prompt more guest activity. Listings priced above $300 represent a comparatively smaller share. Airbnb should urge hosts to keep their nightly rates within the $0-$300 range to create a stable revenue that follows the current trend.
